

MEASURING FOR DOOR WRAPS

1 Measure the width and height of doors

Measure the surface of the doors. Do not include door frames as part of your measurements. Include any kickplates that may be on the door, we are able to cover these with door wrap.

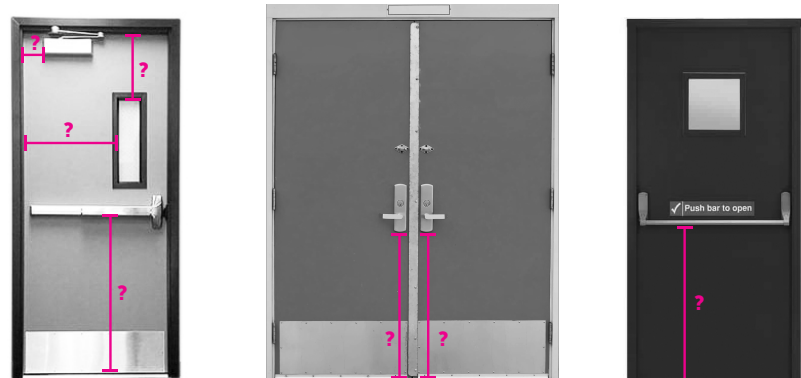

2 Measure width & height of any objects that may interfere with design.

Are there windows? Large faceplates for door handles? Automatic door closers? Include measurements for any object that will interfere, these will not be wrapped.

3 Provide measurements to help locate where any objects are on the door.

Help us in locating where an interfering object is located in relation to the door. Measure from the bottom or top of the door to identify its location vertically. If needed, also measure from the left or right edge of the door to identify its horizontal location.

4 Provide photos of each door and any other directions
